

Dear friends!

You have just installed an application that demonstrates the usage of SignToLogin SDK developed by the Science and Technology Center "KASIB". Using our API you can recognize handwritten signatures of your remote partners on documents!

You often get signed agreements and contracts via email. There is a signature on a document... But how can you know it was your remote partner or employee who signed the document?

Now you have a solution! Use SignToLogin SDK in your mobile applications.

Register in the SignToLogin system. Create a signature sample by signing 10 times. The detailed information about our algorithms you can find at <http://signtologin.com>.

This demo application is developed to sign PDF documents. The application has intuitive functions. You can:

Sign a document

Save a signed document

Email a document

View a history of signed documents

Put your signature on a document and the image of your signature will contain a link to Signtologin SDK* web site. By clicking the link you can learn: who signed the document, the match ratio for the owner's signature, when the document was signed, where it was signed (if the option is enabled), the partner's photo in the moment of signing (if he/she wants).

Do you want to see it? Click my signature below.

Best regards,

Pavel Lozhnikov

* Attention! SigntologinAPI Web site does not save copies of your documents! We use only a document hash to link a signature to.
